Third Series 1968: July-December Copyright Office, Library of Congress **Analysis of Accidents and Injuries of Construction Equipment Operators** Background-Safety continues to be one of the toughest challenges of the construction industry. The construction equipment operators referred here as heavy equipment operators are the class that operates a variety of heavy construction equipment. They perform diverse tasks and hence have the potential to be exposed to different types of injuries. Objective - To analyze the previous occurrences of accidents recorded by OSHA and verify the causation factors by means of a field study. The second objective is to check if the observed group is ergonomically safe. Method - OSHA has maintained a systematic record of accidents of equipment operators in the IMIS database (Integrated Management Information Systems) in the form of short summaries. The accident summaries are compiled and graphs are plotted to establish specific patterns in the occurrences of accidents. A group of construction equipment operators was observed on a construction site with the help of a checklist and Rapid Upper Limb Assessment (RULA) template to identify the accident causing practices followed and check if the amount of physical load imposed is within allowable range as stated by RULA tables. Results - The analysis showed that more than 50% accidents are a result of human error. The other causation factors observed were environmental interference, equipment breakdown and failure to comply with safety standards by the employer. The ergonomic evaluation showed that the group requires further investigation and immediate modifications in the working conditions. Conclusions - Intensive employee training, regular safety feedback and mandatory use of Personal Protective Equipment (PPE) are recommended to improve the safety of construction equipment operators. Modifications in the operator's seat are recommended to reduce the threat of excessive physical loads. **Air Defense Artillery The 2002 Guide to the Evaluation of Educational Experiences in the Armed Services Air Force, Coast Guard, Department of Defense, and Marine Corps** Greenwood Long considered to be the standard reference work in this area, this three-volume set describes more than 8,000 courses offered between January 1990 and the present by various service branches and the Department of Defense. The brush-clearing head has an aluminum alloy housing with three replaceable steel blades that do not have to be sharpened. The head eliminates many of the problems encountered when using circular saw blades to cut brush. The new tool may make it possible to thin stands of lodgepole pine or ponderosa pine while the trees are still young and small. Trees in these stands have usually been allowed to grow large enough so that they could be safely cut with chain saws. The crowded stands were growing slowly during this period. If the stands were thinned earlier, the remaining trees would grow more quickly, and wildlife species that prefer open stands would benefit. However, when trees are small, they must be cut off near the ground during thinning to keep their lowest limbs from regrowing. Making cuts close to the ground with chain saws can be dangerous and is tiring. In addition, chain saw blades must be resharpened when they strike rocks or dirt. So must the blades of circular saws. The steel blades of the head do not require sharpening, but they must be replaced when the blades have become too badly worn. In rocky areas, blades might have to be replaced daily. The head throws debris that can cause injuries. Operators must wear protective equipment. Even though operators wore protective equipment during the evaluations, they suffered minor injuries in the chest and groin. **Gravel Roads Maintenance and Design Manual** The purpose of this manual is to provide clear and helpful information for maintaining gravel roads. Very little technical help is available to small agencies that are responsible for managing these roads. Gravel road maintenance has traditionally been "more of an art than a science" and very few formal standards exist. This manual contains guidelines to help answer the questions that arise concerning gravel road maintenance such as: What is enough surface crown? What is too much? What causes corrugation? The information is as nontechnical as possible without sacrificing clear guidelines and instructions on how to do the job right. **EPA-430/1 Bulletin of the United States Bureau of Labor Statistics U.S. Army formal schools catalog Heavy Equipment Operations Trainee guide.
