Principles of Digital Communication A Top-Down Approach Representing Time An Essay on Temporality as Modality [Oxford University Press](#) Thinking and speaking about time is ridden with puzzles and paradoxes. How do human beings conceptualize time? Why, for example, does the availability of tense vary in different languages? How do the lines of information from tense, aspect, temporal adverbs, and context interact in the mind? Does time describe events? If real time does not flow, where do the concepts of the past, present and future come from? Are they basic concepts or are they composed out of more primitive constituents? And, finally, what is the semantics of expressions with temporal reference? This book offers a new approach to the representation of meaning of temporally-located utterances and discourses. Temporality, the author suggests, should be taken to mean degrees of certainty, understood in turn as degrees of acceptability concerning the eventuality referred to in the speaker's utterance. She presents theoretical arguments and empirical evidence from Indo-European and non-Indo-European languages to show that speakers represent the past, present, and future as degrees of epistemic modality. She argues that temporality can be subsumed under the general label of acceptability or attitude and, rather like the semantic category of evidentiality, founded on the strength of evidence. In the approach she develops, modality provides basic conceptual building blocks for the concept of time and at the same time semantic building blocks for representing temporal expressions in her framework of Default Semantics. Dr Jaszczolt sets the results of her research in the context of linguistic and philosophical work in semantics and pragmatics. **Digital Design: Principles And Practices, 4/E** [Pearson Education India](#) An Introduction to Analog and Digital Communications, 2nd Edition [Wiley Global Education](#) The second edition of this accessible book provides readers with an introductory treatment of communication theory as applied to the transmission of information-bearing signals.
