Rational Design for Structural Building Systems

Construction and Design Manual

This monograph presents the results of theoretical and experimental studies as well as the design and construction features of structural systems with rational parameters. It starts by outlining issues around the topological (bionic) optimization of structures and suggests ways to address them. The computational compiler underlying the proposed approach incorporates the finite element method and the adaptive evolution method. Thus, this volume outlines new energy principles that speak in favour of the proposed methodology. The solutions presented here were verified experimentally using new methods for testing structures for the effects of force and temperature. The theoretical studies also provide a methodology for assessing the technical condition, durability, and service life of structures. The book sets out the specific features of the design and construction of systems produced using the proposed approach. New reinforced-concrete, steel-reinforced-concrete, and steel systems, as well as manufacturing and construction technologies, are described in detail. Designs for buildings, structures, and pedestrian and road bridges are shown. Examples of erected structures are cited, and issues with regard to designing large-span suspension systems with

rational parameters are considered. The manual is intended for engineers and researchers dealing with creating, studying, designing, and erecting engineering structures and systems thereof; structural- and civil-engineering teachers and students may also find it handy.

Aircraft Structures for Engineering Students

Structural Engineering Art and Approximation 2nd edition

Paragon Publishing 'It is better to be roughly right than precisely wrong.' John Maynard Keynes This book contains approximate structural calculation methods for engineers and architects. For easy reference and assimilation it is broken down into categories from simple beams to more complex examples. With numerous figures and photographs it closely relates theory to real structures. Engineering Structures is mostly formally taught in a lecture room with little time devoted to real examples. On graduation an engineer has to cope with turning this eagerly acquired knowledge into reality. To make sense of this a designer needs to be able to test their ideas with a simple set of tools which involve little more than pen, paper and calculator. Architects often wonder if there is an easier way to evaluate alternative structural solutions in their designs. For more information see www.struartapp.com
