The Urban Forest

Cultivating Green Infrastructure for People and the

Environment

Springer This book focuses on urban "green infrastructure" - the interconnected web of vegetated spaces like street trees, parks and peri-urban forests that provide essential ecosystem services in cities. The green infrastructure approach embodies the idea that these services, such as storm-water runoff control, pollutant filtration and amenities for outdoor recreation, are just as vital for a modern city as those provided by any other type of infrastructure. Ensuring that these ecosystem services are indeed delivered in an equitable and sustainable way requires knowledge of the physical attributes of trees and urban green spaces, tools for coping with the complex social and cultural dynamics, and an understanding of how these factors can be integrated in better governance practices. By conveying the findings and recommendations of COST Action FP1204 GreenInUrbs, this volume summarizes the collaborative efforts of researchers and practitioners from across Europe to address these challenges.

Assessing Urban Forest Effects and Values

San Francisco's urban forest

An analysis of trees in San Francisco, CA reveals that this city has about 669,000 trees with canopies that cover 11.9 percent of the area. The most common tree species are blue gum eucalyptus, Monterey pine, and Monterey cypress. The urban forest currently stores about 196,000 tons of carbon valued at \$3.6 million. In addition, these trees remove about 5,200 tons of carbon per year (\$95,000 per year) and about 260 tons of air pollution per year (\$1.3 million per year). The structural, or compensatory, value is estimated at \$1.7 billion. Information on the structure and functions of the urban forest can be used to improve and augment support for urban forest management programs and to integrate urban forests within plans to improve environmental quality in the San Francisco area.

Fungal Strategies of Wood Decay in Trees

Springer Science & Business Media **Wood-destroying fungi play an important role in nature, because they are the only forms of life capable of reducing wood to its initial constituents. However, they can also be dangerous for people and property, as they can impair the stability and fracture-safety of trees. This book gives detailed information, based on new and original scientific findings, on the examination and effects of the most important species of fungi associated with failure of infected urban trees. In addition, new ways are presented for predicting the advance of decay in the living tree. The subject is illustrated and made easily accessible by numerous colored photos of fungus fruit bodies, defect symptoms, and macroscopic and microscopic pictures of wood decay. A detailed introduction to the fundamentals of wood pathology provides a way into the subjects of applied mycology and tree care for readers without previous special knowledge. Francis W.M.R. Schwarze, National Diploma of Arboriculture at Merrist Wood College, UK (1991), Master of Science in Pure, Applied Plant and Fungal Taxonomy, University of Reading, UK (1992), doctorate at Freiburg University (1995), since 1996 assistant at the Institute for Forest Botany and Tree Physiology at Freiburg University, concentrating on research into wood-destroying fungi and host-fungus interactions. Julia Engels, Diploma Forester at Freiburg University (1995), doctorate on root fungi at Freiburg University (1998). Since 1998 active in tree care and mycology in Luxembourg. Strategic Planning for the Florida Citrus Industry

Addressing Citrus Greening Disease

National Academies Press **Citrus greening, a disease that reduces yield, compromises the flavor, color, and size of citrus fruit and eventually kills the citrus tree, is now present in all 34 Floridian citrus-producing counties. Caused by an insect-spread bacterial infection, the disease reduced citrus production in 2008 by several percent and continues to**

spread, threatening the existence of Florida's \$9.3 billion citrus industry. A successful citrus greening response will focus on earlier detection of diseased trees, so that these sources of new infections can be removed more quickly, and on new methods to control the insects that carry the bacteria. In the longer term, technologies such as genomics could be used to develop new citrus strains that are resistant to both the bacteria and the insect.

Tropical Community Tree Guide

Benefits, Costs, and Strategic Planting

DIANE Publishing Even as they increase the beauty of our surroundings, trees provide us with a great many ecosystem services, incl. air quality improvement, energy conservation, stormwater interception, and carbon dioxide reduction. These benefits must be weighed against the costs of maintaining trees, including planting, pruning, irrigation, admin., pest control, liability, cleanup, and removal. This report presents benefits and costs for representative small, medium, and large trees in the Tropical region based on research carried out in Honolulu, Hawaii. Average annual net benefits increase with tree size and differ based on location:. Two hypothetical examples of planting projects are described to illustrate how the data in this guide can be adapted to local uses.

Breadfruit Agroforestry Guide

Planning and Implementation of Regenerative Organic

Methods

Breadfruit has been cultivated by people for thousands of years in highly productive plantings together with numerous other crops. This book was written for commercial and home growers looking to combine modern horticultural techniques with traditional growing methods similar to those successfully employed by Pacific Islanders over many centuries. This groundbreaking guide is being released as the prolific Pacific Island staple breadfruit enjoys a resurgence in planting and growing across Hawai'i and around the tropical world. Noted for its high nutritional value, gluten-free status, and moderate glycemic index, breadfruit (called 'ulu in Hawaiian) can be prepared similarly to a potato or yam but has greater versatility and qualities well suited for main dishes, desserts, baked goods, and even beverages. Breadfruit trees are abundant producers and require far less labor compared with other starchy crops such as taro and sweet potato. The guide presents techniques that can sustain productivity for long periods of time, while regenerating land degraded by erosion, compaction, overgrazing, and loss of organic matter. It covers subjects that include recognizing breadfruit varieties; agroforest planning, planting, and maintenance; selection of suitable accompanying crops; value-added products; and economic evaluation. The guide provides a range of growing scenarios from backyard gardens to large farms in the tropics. Using detailed design examples, species tables, and design descriptions and 95 photos and illustrations, this handbook breaks new ground in showing growers how to plan and implement agroforestry that emphasizes breadfruit production. In so doing, growers can design their production to be resilient to changes in weather and market prices-and build a stronger local food system in the process.
