CRC Press These volumes present the main classes of useful laboratory model systems used to study microbial ecosystems, with emphasis on the practical details for the use of each model. The most commonly used model, the homogeneous fermenter, is featured along with linked homogeneous culture systems, film fermenters, and percolating columns. Additionally, gel-stabilized culture systems which incorporate molecular diffusion as their main solute transfer mechanism and the microbial colony are explained. Chapters comparing model systems with "microcosms" are included, along with discussions of the value of computer models in microbial ecosystem research. Highlighted is a global discussion of the value of laboratory models in microbial ecology.

## Concepts and Applications

John Wiley & Sons An accessible introduction to the world of microbes—from basic microbe biology through industrial applications. Microbes affect our lives in a variety of ways—playing an important role in our health, food, agriculture, and environment. While some microbes are beneficial, others are pathogenic or opportunistic. *Microbes: Concepts and Applications* describes basic microbe biology and identification and shows not only how they operate in the subfields of medicine, biotechnology, environmental science, bioengineering, agriculture, and food science, but how they can be harnessed as a resource. It provides readers with a solid grasp of etiologic agents, pathogenic processes, epidemiology, and the role of microbes as therapeutic agents. Placing a major emphasis on omics technology, the book covers recent developments in the arena of microbes and discusses their role in industry and agriculture, as well as in related fields such as immunology, cell biology, and molecular biology. It offers complete discussions of the major bacterial, viral, fungal, and parasitic pathogens; includes information on emerging infectious diseases, antibiotic resistance, and bioterrorism; and talks about the future challenges in microbiology. The most complete treatment of microbial biology available. *Microbes* features eye-opening chapters on: Human and Microbial World Gene Technology: Application and Techniques Molecular Diagnostic and Medical Microbiology Identification and Classification of Microbes Diversity of Microorganisms Microbes in Agriculture Microbes as a Tool for Industry and Research Complete with charts and figures, this book is an invaluable textbook for university teachers, students, researchers, and people everywhere who care about microorganisms.

## Effect of Oxygen on N<sub>2</sub> Fixation by *Spirillum Lipoferum*

The effect of dissolved oxygen tension (DOT) on the growth rate, growth yield, energy efficiency and cell composition of *Spirillum lipoferum* was evaluated in stirred batch and continuous culture at pH 6.8 and 30°C using a growth limiting level of 0.1 electron equivalent (e-eq) succinate/l (0.83 g/l) as the C and e- donor source and N<sub>2</sub> or NH<sub>4</sub><sup>+</sup> as the N source. DOT was controlled using an O<sub>2</sub>-stat with an autoclavable O<sub>2</sub> electrode immersed in the culture, and premixed 1% and 4% O<sub>2</sub> in N<sub>2</sub> as the O<sub>2</sub> supply. The apparent optimum DOT level for N<sub>2</sub>-fixing growth in batch and continuous culture, both from the standpoint of the rate of growth (minimum doubling time, t<sub>d</sub>, of 4.6 hr in batch) and the efficiency of N<sub>2</sub> fixation (26 and 28 mg N<sub>2</sub> fixed/g succinate in batch and continuous culture, respectively), was about 0.0005 atm O<sub>2</sub>. At this optimum DOT for N<sub>2</sub>-fixing growth, the stored organic carbon was estimated indirectly to be 5 to 26% and 2 to 14% (depending on the method of calculation) of the cell dry weight as poly-β-hydroxybutyrate (PHB) for batch and continuous culture, respectively. The dissimilatory electron requirement for N<sub>2</sub> fixation at the optimum DOT level was 33.3 and 34 e-eq succinate dissimilated/mole cell N, for batch and continuous culture, respectively. Under limiting O<sub>2</sub> (e.g. DOT 0.0005 atm O<sub>2</sub>), the t<sub>d</sub> increased to 7.0 hr in batch culture; the storage C increased to 19 and 27 e-eq/mole cell N (about 48 and 57% PHB), whereas N<sub>2</sub> fixation yield decreased to 18 and 15 mg N<sub>2</sub> fixed/g succinate for batch ...
